PROJECT INVESTMENT**Rs. 1,495,000**

Development + Year-1 standard hosting

Rs. 269,100 GST • Rs. 1,764,100 total incl. GST

Includes first-year standard hosting and initial production deployment. Usage-based third-party services remain separate.

01 — Product Vision

A marketplace-style real-estate SaaS MVP built around property discovery, owner listings, enquiries and role-based management.

- Fast property discovery for users.
- Easy listing and lead management for property owners.
- Centralized role-based administration for the platform operator.
- Responsive web experience for management and customers.
- A shared backend so Android and web clients work from the same data.

Core ecosystem

USER

Discover properties, search, filter, save and enquire.

PROPERTY OWNER

Create listings, manage properties, leads and enquiries.

ADMIN

Manage users, owners, listings, approvals, content and analytics.

02 – Recommended Technology

The goal is one major shared codebase, not separate Android and web projects.

- Mobile: React Native + Expo + TypeScript.
- Navigation: Expo Router.
- Web: React Native Web / Expo Web for shared UI and logic.
- Backend: Supabase + PostgreSQL.
- Authentication: Supabase Auth + role-based access controls.
- Data security: PostgreSQL Row Level Security.
- Notifications: Firebase Cloud Messaging.
- Maps: Google Maps or another suitable provider.
- Server data: TanStack Query + lightweight client state.

Why this approach

SHARED DEVELOPMENT

Shared TypeScript, models, validation, business logic, API layer and design system.

PERFORMANCE

Native Android capability remains available for platform-sensitive features.

WEB QUALITY

Web layouts can be adapted for desktop instead of forcing a mobile UI onto a wide screen.

FUTURE-FRIENDLY

Platform-specific code is used only where it materially improves UX, performance or native capability.

03 – User Android Application

The consumer-facing property discovery experience.

- User registration / login.
- Home feed and featured properties.
- Search by location, locality, area or keyword.
- Filters: sale/rent, property type, price, bedrooms, furnishing, amenities and more.
- Property detail with photos, information, location and owner/contact options.
- Save / favourite properties.
- Recent searches and viewed properties.
- Send enquiry to owner.
- Request callback / contact.
- Profile and account management.
- Notifications for relevant property updates and enquiry responses.

Discovery UX

SEARCH-FIRST

Fast search, filters and sorting designed for frequent mobile use.

VISUAL PROPERTY CARDS

Large imagery, clean details and clear contact actions.

04 — Property Owner Android Application

A dedicated owner workspace for publishing inventory and managing incoming leads.

- Owner registration / login.
- Owner profile and business details.
- Add new property listing.
- Edit, pause, publish or remove listing.
- Property media upload and gallery management.
- Property information, price, area, bedrooms, amenities, location and description.
- Manage multiple properties.
- View enquiries and leads.
- Respond / contact interested users.
- View property performance and basic analytics.
- Notifications for new leads, enquiries and listing events.

Owner workflow

Add property → Submit → Approval (where required) → Publish → Receive enquiries → Follow up

05 – Admin, Super Admin & Role-Based Management

A permission-driven control system rather than a single unrestricted admin account.

ROLE	PRIMARY ACCESS
SUPER ADMIN	Full platform configuration, roles, permissions, users, owners, listings, settings and reports.
ADMIN	Operational management according to assigned permissions.
STAFF / MODERATOR	Restricted customer, listing and support workflows according to permission set.
PROPERTY OWNER	Only own listings, enquiries and permitted owner functions.
USER	Only own account, saved items, enquiries and user functions.

Permission examples

- View / create / edit / delete listings.
- Approve or reject property submissions.
- View user or owner information.
- Manage categories, amenities and locations.
- Access reports or financial / operational data where permitted.
- Restrict selected screens and actions by role.

06 — Responsive Admin / Management Web Panel

The primary management console, designed for desktop and mobile browsers.

DASHBOARD

Users, owners, properties, enquiries and operational summary.

LISTINGS

Review, approve, edit, publish, pause and moderate properties.

OWNERS

Manage property owners, verification/status and their listings.

USERS

Manage accounts, status, roles and activity.

CONTENT

Categories, property types, amenities, locations and platform content.

REPORTS

Listings, enquiries, users, owners and activity reports.

07 — Customer-Facing Responsive Web

A responsive property discovery website accessible from mobile, tablet and desktop.

- Property search and filtering.
- Listing cards and property details.
- Image gallery.
- Location / map view.
- Enquiry / contact owner.
- Favourites / saved listings when logged in.
- Responsive layouts for smartphone and desktop.
- SEO-friendly public property pages where appropriate.
- Basic account and enquiry history.

Web UX principle

The website uses the same product language and design system as the Android app while allowing web-specific layouts for larger screens.

08 — Property Listing & Moderation System

The core inventory layer for a credible marketplace.

- Structured property listing fields.
- Property type and listing type (sale/rent).
- Price and pricing metadata.
- Area / size / bedrooms / bathrooms / furnishing.
- Amenities and features.
- Address and map location.
- Property photos / media.
- Owner association.
- Listing states: draft, pending, approved, published, paused, rejected.
- Admin moderation and approval workflow.
- Edit history / operational activity where required.

Listing lifecycle

Draft → Submitted → Review → Approved → Published → Enquiry → Follow-up → Sold / Rented / Archived

09 — Backend, Data & Security

A structured backend designed for a role-driven SaaS application.

- PostgreSQL database.
- Authentication and session management.
- Role-based authorization.
- Row Level Security / permission enforcement at the data layer.
- Property, user, owner, enquiry and activity models.
- Image/media storage.
- API and server-side validation.
- Push notification infrastructure.
- Basic audit / activity records.
- Backup and production configuration.

Security principle

Permissions must be enforced on the backend, not only by hiding screens in the frontend. This prevents users from bypassing UI restrictions through direct API access.

10 – Maps, Search & Notifications

Fast discovery and useful engagement without overwhelming the interface.

- Map-based property discovery.
- Property location preview.
- Distance / location filters where supported.
- Search suggestions and filtering.
- Push notifications for enquiries, relevant updates and platform events.
- Deep links from notifications into the relevant property, enquiry or management screen.

THIRD-PARTY MAP USAGE

Map, geocoding, routing and related API usage is usage-based and separate from the fixed development fee.

11 – Commercial Investment

Production-oriented MVP scope with both Android applications, responsive web platform and one year of standard hosting.

MODULE	INVESTMENT
User Android Application	Rs. 2,10,000
Property Owner Android Application	Rs. 2,10,000
Responsive Admin / Management Web Panel	Rs. 1,75,000
Customer-Facing Responsive Web Application	Rs. 1,20,000
Backend, PostgreSQL, APIs & Authentication	Rs. 2,00,000
Role-Based Access, Admin/Super Admin & Permissions	Rs. 1,00,000
Property Listing, Search, Maps, Media & Enquiry Engine	Rs. 1,35,000
UI/UX, QA, Production Deployment & 12-Month Standard Hosting	Rs. 1,45,000
TOTAL DEVELOPMENT + YEAR-1 PLATFORM FEE	Rs. 14,95,000

Development + Year-1 standard hosting	Rs. 14,95,000
GST @ 18%	Rs. 2,69,100
Total including GST	Rs. 17,64,100

One-year hosting means the included standard production hosting package described in the terms. Usage-based third-party services are separate.

12 – Deployment & 12-Month Hosting

The quotation explicitly includes the first year of standard production hosting.

- Initial production deployment of the approved MVP.
- Standard cloud/server hosting for 12 months from production launch.
- Basic production database and storage setup.
- SSL and normal application configuration.
- Routine deployment/configuration support during the included hosting term.
- Renewal after 12 months is chargeable separately and can be agreed before expiry.

Not included in standard hosting

- High-volume map API usage.
- WhatsApp Business/API usage or conversation charges.
- SMS/OTP charges.
- Payment gateway transaction fees.
- Exceptional storage/CDN/bandwidth usage outside the agreed standard package.
- Premium third-party services not expressly listed in the agreement.

13 — Why React Native + Expo

Selected specifically to minimize duplicate development while maintaining a strong mobile experience.

- Single TypeScript project for Android and web-oriented surfaces.
- Shared design system and components.
- Shared business logic, API layer and validation.
- Native Android modules can be used for device-specific requirements.
- Expo Router provides a unified route structure.
- Web can use responsive layouts instead of forcing a mobile layout onto desktop.
- Avoids maintaining two completely separate Android codebases.

Platform strategy

User and owner Android applications remain separate product experiences, but are built from the same shared codebase. The web applications/panels reuse the same types, logic, design system and backend while allowing web-specific layouts where that produces a better UX.

14 – 2026 Market & Currency Context

The proposal is priced in Indian rupees and positioned for a multi-role SaaS MVP rather than a basic single-feature app.

USD / INR reference

The Indian rupee closed at approximately Rs. 95.4250 per US\$1 on 14 August 2026, according to Reuters. The Rs. 14,95,000 project fee is approximately US\$ 15,667, while the total including GST is approximately US\$ 18,487.

REFERENCE	VALUE
USD/INR (14 Aug 2026 close)	Rs. 95.4250 / US\$1
Project fee	Rs. 14,95,000
Approx. USD fee	US\$ 15,667
GST	Rs. 2,69,100
Total incl. GST	Rs. 17,64,100
Approx. USD total	US\$ 18,487

Pricing rationale

- Current Indian 2026 guides show wide ranges depending on complexity, integrations, quality and vendor.
- This proposal includes two Android products, responsive web applications, backend/security, RBAC, maps/search, media, enquiries, QA/deployment and one year of standard hosting.
- The quoted fee is positioned as a professional production-oriented MVP, not a basic single-feature app.

15 – Third-Party & Usage-Based Charges

These costs remain separate so the fixed project price stays predictable.

MAPS / GEOCODING / ROUTING

Not included. Charged according to actual provider usage and pricing.

SMS / OTP

Not included. Charged by the selected provider.

WHATSAPP / MESSAGING

Not included. Conversation/message charges depend on provider rules and usage.

PAYMENT GATEWAY

Not included. Transaction and settlement charges are separate.

PREMIUM CLOUD / STORAGE

Not included beyond the standard first-year hosting package.

16 – Source Code & Delivery Terms

The commercial terms are explicit about what happens after the project is paid for.

SOURCE CODE DELIVERY

Upon receipt of 100% of the agreed project payment, the project source code developed specifically for this project will be delivered to the client.

- Delivery includes the agreed user Android application, owner Android application, web applications/panels, backend/API code and project-specific documentation/configuration required for normal maintenance and deployment.
- Third-party SDKs, APIs, open-source libraries, platform services, fonts, trademarks and proprietary components remain subject to their own licenses.
- Client may maintain and modify the delivered project for its own business use after source-code handover.

17 — Resale, White-Label & Redistribution

The platform is commissioned for the client's own real-estate business and is not a resale product.

RESELLING / WHITE-LABELING IS PROHIBITED

The client may not sell, resell, sublicense, lease, rent, white-label, distribute, commercially transfer, package or offer the delivered project/source code as a software product or service to third parties without prior written permission from Banarasi Kumar Sahu.

Permitted internal use

- The client may operate the software for its own real-estate business and serve its own customers.
- The client may engage another developer/agency to maintain the delivered project for its own business use, subject to third-party licenses.
- Any separate SaaS resale, franchise, white-label, multi-client deployment, licensing or commercial distribution arrangement requires written approval and may require a separate commercial agreement.

18 — Scope Notes & Support

Clear boundaries keep delivery predictable for both parties.

Included

- Core applications and responsive interfaces described in this quotation.
- UI/UX design direction and responsive layouts for defined workflows.
- Testing and bug fixing for agreed scope.
- Production deployment assistance.
- Basic handover and documentation.

Not included unless separately agreed

- Advanced route optimization or AI route planning.
- Accounting/ERP integration, warehouse management or complex commission/payroll.
- GST e-invoicing or advanced tax automation.
- WhatsApp Business/API, SMS/OTP, payment gateway, maps/API and other usage fees.
- Cloud hosting beyond the included first year, domains and app-store account charges.
- Large-scale data migration or extensive manual product entry.

Support

Post-launch defect support can be defined in the final development agreement. Ongoing maintenance, new features and third-party changes should be covered under a separate support / AMC arrangement.

19 – Delivery Timeline & Payment Milestones

A staged rollout keeps progress visible and approvals straightforward.

MILESTONE	SHARE	AMOUNT
Project commencement	40%	Rs. 5,98,000
Core modules / staging release	30%	Rs. 4,48,500
UAT / feature completion	20%	Rs. 2,99,000
Production deployment / handover	10%	Rs. 1,49,500

Estimated timeline

- Discovery & UX – approximately 2 weeks.
- Core platform – approximately 3 weeks.
- Field/user/owner applications – approximately 5–6 weeks.
- Admin web + customer web – approximately 3 weeks.
- QA, UAT, deployment and launch – approximately 2–4 weeks.
- Overall target: approximately 16–20 weeks, subject to approvals, data readiness, third-party accounts and scope stability.

PROPOSAL SUMMARY

A DIGITAL REAL-ESTATE PLATFORM BUILT FOR SCALE

A cohesive user, property-owner and management experience with shared infrastructure, strong performance and a clear SaaS foundation.
